Q1) The annual rainfall at a particular geographical location is modeled as **normal random variable** with a **mean** of 60 cm and **std dev** of 20 cm. What is the probability that this year the average rainfall will be **at most** 80 cm?

**Solution:** Let X represent the mean rainfall.  
You have to find  
 $P(\text{mean rainfall is at most 80 cm})$   
 $= P(X < 80)$

First, we convert normal RV to standard RV  
 $X = 80 \Rightarrow Z = 1.00$

Normal R.V.  $\Rightarrow$  Standard R.V.  
 $X \qquad \qquad \qquad Z = \frac{X - \mu}{\sigma}$

$P(X < 80)$   
 $= P(Z < 1)$   
 $= 0.8413$

$X = 80 \quad \Rightarrow \quad Z = \frac{80 - 60}{20} = 1$

Q2) The annual rainfall at a particular geographical location is modeled as **normal random variable** with a **mean** of 60 cm and **std dev** of 20 cm. What is the probability that this year the average rainfall will be **at least** 80 cm?

**Solution:** Let X represent the mean rainfall.  
You have to find  
P(mean rainfall is **at least** 80 cm)  
= P(X > 80)

First, we convert normal RV to standard RV  
X = 80 => Z = 1.00

$$\begin{aligned} P(X > 80) &= P(Z > 1) \\ &= 1 - P(Z < 1) \\ &= 1 - 0.8413 \\ &= 0.1587 \end{aligned}$$

Normal R.V.  $\Rightarrow$  Standard R.V.  
 $X \Rightarrow Z = \frac{X - \mu}{\sigma}$

$X = 80 \Rightarrow Z = \frac{80 - 60}{20} = 1$

Q3) The average height of a person is modeled as **normal random variable** with a **mean** of 179 cm and **std dev** of 10 cm. What is the probability that a random person selected height is **at most 170** cm?

**Solution:** Let X represent the height.  
You have to find  
 $P(\text{mean height is at most 170 cm})$   
 $= P(X < 170)$

First, we convert normal RV to standard RV  
 $X = 170 \Rightarrow Z = -0.90$

Normal R.V.  
 $X$

$\Rightarrow$

Standard R.V.  
 $Z = \frac{x - \mu}{\sigma}$

$x = 170 \Rightarrow Z = \frac{170 - 179}{10} = -0.9$

$P(X < 170)$   
 $= P(Z < -0.9)$   
 $= 0.1841$

Q4) The average height of a person is modeled as **normal random variable** with a **mean** of 179 cm and **std dev** of 10 cm. What is the probability that a random person selected height is **at least 170** cm?

**Solution:** Let X represent the height.

You have to find

$P(\text{mean height is at least 170 cm})$   
 $= P(X > 170)$

First, we convert normal RV to standard RV

$X = 170 \Rightarrow Z = -0.90$

Normal R.V.  $\Rightarrow$  Standard R.V.  
 $X \qquad \qquad \qquad Z = \frac{X - \mu}{\sigma}$

$X = 170 \Rightarrow Z = \frac{170 - 179}{10} = -0.9$

$P(X > 170)$   
 $= P(Z > -0.9)$   
 $= 1 - P(Z < -0.9)$   
 $= 1 - 0.1841$   
 $= 0.8159$

-0.1	0.4602	0.4562	0.4522	0.4483	0.4443	0.4404	0.4364	0.4325	0.4286	0.4247

Q5) The average height of a person is modeled as **normal random variable** with a **mean** of 179 cm and **std dev** of 10 cm. What is the probability that a random person selected height is **between 160 cm and 170 cm**?

**Solution:** Let X represent the height.

You have to find

$$\begin{aligned} &P(\text{mean height between 160 cm and 170 cm}) \\ &= P(160 < X < 170) \end{aligned}$$

First, we convert normal RV to standard RV

$$x_1 = 160 \Rightarrow z_1 = -1.90$$

$$x_2 = 170 \Rightarrow z_2 = -0.90$$

$$\begin{array}{ccc} \text{Normal R.V.} & \Rightarrow & \text{Standard R.V.} \\ X & & Z = \frac{x - \mu}{\sigma} \end{array}$$

We see from z-table:

$$P(Z < -1.9) = 0.0287$$

$$P(Z < -0.9) = 0.1841$$

So ,

$$P(160 < X < 170)$$

$$= P(-1.9 < z < -0.9)$$

$$= 0.1841 - 0.0287$$

$$= 0.1554$$

= 15.54% that a randomly chosen person height is between 160 cm and 170 cm

Q6) Suppose normal human body temperature follows a normal distribution with mean 98.6 deg Fahrenheit and standard deviation of 0.7 deg Fahrenheit  
What is the probability that a randomly chosen patient's temperature is between 98°F and 99°F?

**Solution:** Let X represent the temperature.

You have to find

$$\begin{aligned} &P(\text{temperature is between } 98^\circ\text{F and } 99^\circ\text{F}) \\ &= P(98 < X < 99) \end{aligned}$$

First, we convert normal RV to standard RV

$$x_1 = 98 \Rightarrow z_1 = -0.86$$

$$x_2 = 99 \Rightarrow z_2 = +0.57$$

$$\frac{\text{Normal R.V.}}{X} \Rightarrow \frac{\text{Standard R.V.}}{Z = \frac{x - \mu}{\sigma}}$$

We see from z-table:

$$P(Z < -0.86) = 0.1949$$

$$P(Z < 0.57) = 0.7157$$

So ,

$$P(98 < X < 99)$$

$$= P(-0.86 < z < +0.57)$$

$$= 0.7157 - 0.1949$$

$$= 0.5208$$

$$= 52.08\% \text{ that a randomly chosen patient's temperature is between } 98^\circ\text{F and } 99^\circ\text{F}$$
